Milestone 5.
11/9/2020

I am more or less where I want to be on this project. Though I am wondering if I will manage the final part listed in the last bullet! :)

This weekend I got the novice and registration functions to work.
- Novices can register with their personal details and their information is saved to the database using stored procedures.
- Experts can register with their personal details and their information is saved to the database using stored procedures.
  - However, the expert registration process is more complicated as I need to add categories and subjects. I worked on that today, 11/8, but am a bit unclear on exactly how to implement that. I got a dropdown box that works to pull in categories from the database, but have set up a meeting to go through the db questions on 11/9.

Below is my timeline for finishing the project before I present on 11/17.
- 11/10 - Finished with all 'input' procedures
  - Experts and novices can register, and experts will also have their categories, subjects and experiences entered into the database.
- 11/12 - Start on displaying all the information from the database on to the front end.
  - Novices will have a profile page that they can view once they login with username and password.
  - Experts will have a profile page that they can view once they login with username and password, including their categories and subjects of expertise.
- 11/14 - Finish both profile pages.
- 11/15 - Create the final piece where novices can select the category of expertise they are searching for, and be brought to a page with displaying matching experts.
- 11/17 - Present.
